

Changelog for Manual Transmission for GTA V

5.8.5

- HUD: Add handbrake bar to pedal input box
- Wheel: Make toggling handbrake optional for analog handbrakes
- Wheel: Fix force feedback spring effect not being disabled on launch
- Fix Native controller input method triggers
- Fix features coupled to first person camera mode not working with independent camera modes
- Fix quadbikes having lean forces disabled
- Fix telemetry direction vectors missing forward vector and wrong right vector

5.8.4

- Resolve `getScriptHandleBaseAddress` dynamically for FiveM compatibility

5.8.3

- Update memory code for Legacy 1.0.3788.0, fixing crashes
- Update memory code for Enhanced 1.0.1013.33
- Update menu for Enhanced record global
- Update menu for hotkey falsely triggering on camera switch
- Fix wheel button-axis override input detection
- Fix Native gamepad inputs wrongly triggering
- Increase UpshiftLoad top range from 0.2 to 1.0

5.8.2

- Fix flickering inputs caused by unmapped keyboard values reading invalid data
- Fix and restore older "hold to X" behavior on gamepad to pre-5.8.0 behavior

5.8.1

- Update patches for Enhanced 1.0.889.15
- Fix keyboard and wheel button "tap" action
- Fix recognizing extended keys (function cluster)
- Fix hotwiring animations not playing with synced steering animations
- Remove usage of ScriptHookV's `getScriptHandleBaseAddress` for FiveM compatibility

Notes:

- Button tap action fix may or may not fix flickering indicators and assists. I'd happy happy to hear if this did anything or if I need to look further. Details are appreciated, I haven't managed to reproduce it.

5.8.0

- Add handbrake hold-to-toggle functionality
To use: Enable in Gameplay Assists. Hold handbrake for 0.5 seconds to keep it on. Disengage by driving

away or briefly tapping the handbrake.

- Update game version detection
- Update patches and vehicle offset for Enhanced
- Fix force feedback per-vehicle curve multiplier not applied
- Fix analog handbrake doing nothing when Manual Transmission is off

5.7.3

- Add support for externally cancelled indicators (e.g. Moza Multifunction Stalks)
To use: Unassign old indicator buttons and assign new **Indicator left/right/cancel (stalk)** buttons
- Fix broken collision force feedback since 5.7.0
- Improve collision effect using jerk and directionality
- Fix telemetry RPM x10 issue for SimHub etc. (Still same DiRT 4 format)
- License: Fix an issue that causes added hardware possibly causing premature license expiration

5.7.2

- Hotfix for 5.7.1: Fix camera spinning when using wheel

5.7.1

- Add analog camera support for steering wheels
- Improve re-identification support for composite devices, e.g. newer Fanatec wheelbases
- Allow manual input for HUD element locations
- UDP Telemetry: Read fuel volume from handling instead of fixed 65L
- Fix last analog axis (Slider1) not being picked up during assignment
- Fix nonfunctional buttons for analog actions

5.7.0

- Add a demo mode for 15 minutes x 4 trial usage
- Add force feedback effects for surface textures
- Automatically resolve devices with changed Instance GUIDs
- Clarify "Enhanced Steering"-related descriptions in the menus
- Rename confusing force feedback settings
- Improve steering wheel devices initialization
- Improve force feedback initialization

5.6.3

- Improve license check for switchable GPU systems

5.6.2

- Require a license to use
- Fix traction control acting with too little wheelspin
- Fix adaptive cruise control
- Update for b3095+ compatibility

5.6.1 and older

Changelogs for older versions can be found [in the original repository](#).
